SHARED PRESCRIBING GUIDELINE
DRUG: PRESCRIBING OF LITHIUM FOR ADULTS

Introduction
Licensed Indications
1. In the management of acute mania or hypomanic episodes
2. In the management of episodes of recurrent depressive disorders where treatment with other antidepressants has been unsuccessful
3. In the prophylaxis against bipolar affective disorders
4. Control of aggressive behaviours of intentional self-harm.

Background:
Lithium salts have a narrow therapeutic/toxicity ratio and regular monitoring is required. Prescribing is by brand name and Lancashire Care NHS Foundation Trust (LCFT) prescribes Priadel ® when initiating patients on lithium.

Information in the Priadel Summary of product characteristics (SPC) notes the following target serum lithium concentration ranges in mmol/L.

<table>
<thead>
<tr>
<th></th>
<th>At 12 hours</th>
<th>At 24 Hours</th>
</tr>
</thead>
<tbody>
<tr>
<td>Once daily dosage</td>
<td>0.7-1.0</td>
<td>0.5-0.8</td>
</tr>
<tr>
<td>Twice daily dosage</td>
<td>0.5-0.8</td>
<td></td>
</tr>
</tbody>
</table>

Formulation
Tablets as brand Priadel 200mg and 400mg

Dose and administration
Treatment and Prophylaxis
Dosing information for Priadel® preparations only – for other lithium preparations please refer to the current version of the BNF or individual product SPC:

By mouth

For Adult (body-weight up to 50 kg)
Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised.

For Adult (body-weight 50 kg and above)
Initially 0.4–1.2 g once daily, alternatively initially 0.4–1.2 g daily in 2 divided doses, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised.

For Elderly (over the age of 60 – definition confirmed with the manufacturer of Priadel®)
Initially 200–400 mg daily, dose adjusted according to serum-lithium concentration, doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised.

The dose should be adjusted following lithium levels. Lithium levels should be checked 4–7 days following initiation, then weekly until the desired therapeutic range is achieved.

Responsibilities
Secondary Care Responsibilities are:
1. Lithium therapy will be instigated in secondary care for patients who meet the diagnostic criteria listed above.
2. Before commencing treatment baseline monitoring will be undertaken in secondary care as listed below.
3. Patients and carers will be provided with both written and verbal information to facilitate concordance
4. Women of childbearing age should be advised of the risk of teratogenic effects and the need for effective contraception while taking lithium.
5. Patients will be provided with the NPSA lithium pack including the purple lithium level record book.
6. Patients and carers will be advised of risk situations
7. Patients will be advised that erratic compliance or rapid discontinuation may increase the risk of a manic relapse
8. To initiate treatment
9. To monitor until steady state lithium levels are obtained
10. Older adults will be monitored carefully for symptoms of lithium toxicity because they may develop high levels of lithium at doses in the normal range and lithium toxicity is possible at moderate serum levels.

11. Urea and creatinine levels become elevated, closer monitoring of lithium levels and dose will be undertaken and an assessment made of the rate of deterioration of renal function. Prescribers will consider seeking advice from a renal specialist regarding ongoing treatment.

12. Treatment will be stopped if considered to be no longer appropriate. Lithium should be stopped over at least 4 weeks but preferably over a three month period particularly if there is a history of manic relapse.

Following initiation and stabilisation of the drug the patient will be maintained on lithium for a minimum period of three months to establish response and tolerability. During this period the medication will be prescribed by secondary care.

After this period the patient will be reassessed in secondary care and if:

- The illness has stabilised
- The side effects are manageable
- The target serum lithium level has been achieved
- Adherence to the regime is established

Then a shared prescribing agreement between primary and secondary care to manage the patient should be progressed as follows:

1. A referral letter will be sent to the patient’s general practitioner (GP) asking them to consider the prescribing of lithium under shared prescribing arrangements. This will state if the indication is off label.
2. The shared prescribing guidance will be included with the letter
3. The GP will be informed of the target therapeutic serum lithium level for each individual patient
4. Test results will be communicated to the GP (complete the “copy to” section on the blood form)
5. The patient will be provided with a further 28 days supply of medication during this period to ensure continuity of care
6. The patient will be informed of the process
7. The patients response will be reviewed at regular intervals (to be agreed with the LCFT prescriber)
8. The patient will be reviewed promptly when the GP when undertaking shared care indicates that there are signs of renal impairment, unacceptable side effects or deterioration in mental state.

Where the GP indicates possible signs of toxicity the patient will depending on the clinical picture and/or lithium level results, be reviewed the same day by secondary care services or where emergency management is indicated be sent to accident and emergency or the medical assessment unit for immediate intervention.

Once all if the above are in place and the GP has agreed to participate in shared care arrangements a record will be made in the patients notes and the patient will be informed that their next supply of medication will be obtained from their GP.

### Monitoring undertaken by Secondary Care

<table>
<thead>
<tr>
<th>Baseline monitoring to be completed prior to initiating lithium</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full Blood Count</td>
</tr>
<tr>
<td>Urea and Electrolytes including calcium</td>
</tr>
<tr>
<td>eGFR</td>
</tr>
<tr>
<td>Liver Function (LFT)</td>
</tr>
<tr>
<td>Thyroid Function (TFT)</td>
</tr>
<tr>
<td>Blood Pressure (BP)</td>
</tr>
<tr>
<td>ECG if there are risk factors for or evidence of existing cardiovascular disease as assessed by the clinician</td>
</tr>
<tr>
<td>24 hour creatinine clearance if history of renal infection or problems</td>
</tr>
<tr>
<td>Weight* (BMI)</td>
</tr>
<tr>
<td>Height*</td>
</tr>
</tbody>
</table>

*For children and adolescents weight and height should be monitored monthly for six months, then every six months*

### Continuation monitoring

<table>
<thead>
<tr>
<th>Lithium levels: Obtain lithium levels 12 hours post dose and should always be taken at the same time to give consistent results</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 days after initiation and 7 days after dose increase, then weekly until desired target range is obtained.</td>
</tr>
</tbody>
</table>

**Target range**: 0.4 mmol/L - 1.0 mmol/L (to be identified by secondary care prescriber)

Once stabilised, obtain lithium levels every 3 months for the first year. Maintain 3 monthly monitoring for the following patient groups:

- Elderly,
- Poor adherence
- On Interacting Drugs
- Impaired renal or thyroid function
- Poor Symptom control
- Previous level over 0.8 mmol/L
After the first year, if patient remains stable the monitoring frequency can extend to 6 monthly thereafter. (NICE CG 185)

After initiation patient should be maintained on Lithium for at least three months to establish response and ensure tolerability.

- For new starters consider maintaining plasma levels between 0.6 -0.8 mmol/L
- For patients previously on Lithium that have relapsed or with subthreshold symptoms plus functional impairment- consider maintaining levels between 0.8 -1.0 mmol/L for at least 6 months.
- TFTs, U&E plus Calcium, EGFR should be checked every 6 months. Monitoring frequency should increase if clinical signs of deterioration present or taking interacting drugs like NSAIDS, ACE Inhibitors, and Diuretics.
- Lipid profile annually if over 40 years.
- Once stable, TFTs, Blood Glucose, Weight, Blood pressure annually.
- Weight should be measured more frequently if rapid weight gain occurs

### Primary Care Responsibilities

Primary care responsibilities are:

1. To undertake monitoring as set out below under monitoring in primary care
2. To undertake continuation monitoring as set out and take appropriate action if these tests are abnormal
3. To reduce or discontinue treatment in serious diarrhoea, vomiting or intercurrent infection (especially if sweating profusely). Consideration should be given to stopping lithium for up to seven days if the patient becomes acutely and severely unwell with a metabolic or respiratory disturbance of any cause.
4. To stop lithium if signs of toxicity occur and contact the consultant psychiatrist for advice on treatment and future management
5. To refer back to secondary care for specialist advice if the treatment is ineffective or if the patient develops unacceptable side effects. This is particularly important where patients develop signs of renal impairment.
6. To review the patient in accordance with NICE guidance and advice from LCFT
7. To provide the patient with repeat prescriptions specifying the brand on the prescription. Incorrect dosing can occur if the patient changes preparation.
8. To make a clear statement in the primary care notes showing where the monitoring is being carried out

### Monitoring required in primary care

1. To take serum lithium levels at three monthly intervals and after any dose changes, change of preparation, during an acute UTI, or changes in other medication which may affect lithium levels. Samples must be taken at least 12 hours post dose, and the time of the sample, total daily dose and the time of the previous dose noted on the sample. In the event of a twice daily dosing regimen, the morning dose should be omitted until after the blood sample has been taken.

After the first year, if patient remains stable the monitoring frequency can extend to 6 monthly unless they fulfilling criteria for more frequent monitoring as outlined below. (NICE CG 185)

2. Maintain more frequent (three monthly monitoring) for the following patient groups:
   - Elderly (over the age of sixty)
   - Poor adherence
   - On interacting drugs
   - Impaired renal or thyroid function
   - Poor symptom control
   - Previous level over 0.8mmol/L

3. Target range: 0.4 mmol/L- 1.0 mmol/L, however any patient specific target range will be communicated to primary care by secondary care prescribers

   For new starters consider maintaining plasma levels between 0.6 -0.8 mmol/L

   For patients previously on Lithium that have relapsed or with subthreshold symptoms plus functional impairment- consider maintaining levels between 0.8 -1.0 mmol/L for at least 6 months.

4. TFTs, U&E plus Calcium, EGFR should be checked every 6 months. Monitoring frequency should increase if clinical signs of deterioration present or taking interacting drugs like NSAIDS, ACE Inhibitors, and Diuretics.

5. Once stable, TFTs, Blood Glucose, Weight, Blood pressure checks can be conducted annually for patients who are clinically stable and not prescribed interacting drugs

6. Lipid profile annually if over 40 years.
7. To check patients for side effects and signs of lithium toxicity at each appointment. Toxicity can occur without apparent increase in serum level, and it is important to "treat the patient not the level". Signs of neurotoxicity which can occur at therapeutic levels include paraesthesia, ataxia, tremor and cognitive impairment.

8. Results should be shared with secondary care.

9. To record results in patient’s lithium monitoring booklet

### Adverse Effects

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thirst, polyuria, GI upset</td>
<td>Diabetes insipidus – may inhibit ADH (must maintain fluid intake)</td>
</tr>
<tr>
<td></td>
<td>Acne, Cardiac arrhythmias, Weight gain, oedema, Hypothyroidism, Lethargy, feeling cold, vertigo. <strong>Please refer to the current version of the BNF or individual product SPCs for a complete list of adverse effects.</strong></td>
</tr>
</tbody>
</table>

### Signs of Lithium Toxicity

The onset of symptoms may be delayed, with peak effects not occurring for as long as 24 hours, especially in patients who are not receiving chronic lithium therapy or following the use of a sustained release preparation.

**Mild:** Nausea, diarrhoea, blurred vision, polyuria, light headedness, fine resting tremor, muscular weakness and drowsiness.

**Moderate:** Increasing confusion, blackouts, fasciculation and increased deep tendon reflexes, myoclonic twitches and jerks, choreoathetoid movements, urinary or faecal incontinence, increasing restlessness followed by stupor. Hypernatremia.

**Severe:** Coma, convulsions, cerebellar signs, cardiac dysrhythmias including sinoatrial block, sinus and junctional bradycardia and first degree heart block. Hypotension or rarely hypertension, circulatory collapse and renal failure.

### Action to be taken if level over target range

There is no specific antidote to lithium. In the event of lithium overdose, lithium should be discontinued and lithium serum levels monitored closely.

Supportive treatment should be initiated, which includes correction of fluid and electrolyte balance, if necessary.

Diuretics should not be used (see Section 4.5). All patients should be observed for a minimum of 24 hours. ECG should be monitored in symptomatic patients. Steps should be taken to correct hypotension.

Consider gastric lavage for non-sustained-release preparations if more than 4 g has been ingested by an adult within 1 hour or definite ingestion of a significant amount by a child. Slow-release tablets do not disintegrate in the stomach and most are too large to pass up a lavage tube. Gut decontamination is not useful for chronic accumulation. Activated charcoal does not adsorb lithium.

Haemodialysis is the treatment of choice for severe lithium intoxication (especially in patients manifesting with severe nervous system disorders), or in cases of overdose accompanied by renal impairment. Haemodialysis should be continued until there is no lithium in the serum or dialysis fluid. Serum lithium levels should be monitored for at least another week to take account of any possible rebound in serum lithium levels as a result of delayed diffusion from the body tissues.

In cases of acute on chronic overdose or in cases of chronic lithium toxicity if the lithium concentration is >4.0 mmol/l, discuss with your local poisons service.

Clinical improvement generally takes longer than reduction of serum lithium concentrations regardless of the method used.

### Drug Interactions

<table>
<thead>
<tr>
<th>Drug</th>
<th>Effect</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACE inhibitors and angiotensin II antagonists</td>

<td></td>
</tr>
<tr>
<td>Anticonvulsants</td>
<td>Carbamazepine, oxcarbazepine and phenytoin increase the risk of neurotoxicity with lithium</td>
<td></td>
</tr>
<tr>
<td>Antipsychotics</td>
<td>All antipsychotics can increase the risk of EPSE and neurotoxicity</td>
<td>Commonly used combination but it is rarely seen in practice.</td>
</tr>
<tr>
<td></td>
<td>May increase the risk of neuroleptic malignant syndrome</td>
<td></td>
</tr>
<tr>
<td>Calcium channel blockers</td>
<td>Diltiazem, verapamil increase risk of neurotoxicity</td>
<td></td>
</tr>
<tr>
<td>Diuretics</td>
<td>Loop and thiazide diuretics increase the concentration of lithium</td>
<td>Loop diuretics appear less likely than thiazides to increase levels but still</td>
</tr>
</tbody>
</table>
Caution is advised if lithium is co-administered with other drugs that prolong the QT interval, e.g. quinidine, disopyramide, amiodarone, antiarrhythmic agents, cisapride, antibiotics such as erythromycin, antipsychotics such as thioridazine or amisulpride. The list is not comprehensive.

Contraindications

- Hypersensitivity to lithium or it’s excipients, breast feeding, severe renal impairment (may be given if closely monitored in mild to moderate renal impairment), untreated hypothyroidism, cardiac disease or insufficiency, hyponatraemia, Addison’s disease, Brigade syndrome or family history of Brugada Syndrome
- Lithium should not be used in pregnancy, especially the first trimester, unless considered essential

Contact details

As per correspondence from LCFT

This guidance does not replace the SPC’s which should be read in conjunction [1] [2]

Optional Shared Care Agreement form
Request by Specialist Clinician for the patient’s GP to enter into a shared care agreement

PLEASE NOTE: The use of this form is not compulsory, but the same information must be communicated between the specialist service and primary care in advance of entering into a shared-care agreement.

Part 1 - To be signed by Consultant / Associate Specialist / Speciality Trainee or Specialist Nurse (who must be a prescriber)

Dear Doctor:  
Name of Patient:  
Address:  
Date:  
Patient NHS Number:  
Patient Hospital Number:  
Diagnosed Condition:  

I request that you prescribe:
(1)  
(2)  
(3)  
(4)  

for the above patient in accordance with the LMMG shared care guideline(s) (Available on the LMMG website).

Last Prescription Issued:  
Next Supply Due:  
Date of last blood test (if applicable):  
Date of next blood test (if applicable):  
Frequency of blood test (if applicable):  

I confirm that the patient has been stabilised and reviewed on the above regime in accordance with the Shared Care guideline.
If this is a Shared Care Agreement for a drug indication which is unlicensed or off label, I confirm that informed consent has been received from the patient.

I will accept referral for reassessment at your request. The medical staff of the department are available if required to give you advice.

**Details of Specialist Clinicians**

| Name: | Click or tap here to enter text. |
| Date: | Click or tap to enter a date. |
| Position: | Choose an item. |
| Signature: | Click or tap here to enter text. |

(An email from the specialist clinician will be taken as the authorised signature)

In all cases, please also provide the name and contact details of the Consultant.

When the request for shared care is made by a Specialist Nurse, it is the supervising consultant who takes medicolegal responsibility for the agreement.

**Consultant**

| Name: | Click or tap here to enter text. |

**Contact Details**

| Telephone Number | Click or tap here to enter text. |
| Extension | Click or tap here to enter text. |
| Email Address | Click or tap here to enter text. |

**Part 2 - To be completed by Primary Care Clinician (GP)**

I agree to prescribe and monitor Click or tap here to enter text. for the above patient in accordance with the LMMG shared care guideline(s) commencing from the date of next supply / monitoring (as stated in Part 1 of the agreement form).

| Name: | Click or tap here to enter text. |
| Date: | Click or tap to enter a date. |
| Signature: | Click or tap here to enter text. |

*Please sign and return a copy within 14 calendar days to the address above OR*

If you do not agree to prescribe, please sign below and provide any supporting information as appropriate:

I DO NOT agree to enter in to a shared care agreement on this occasion.
