

Primary Care Adult Headache Management Pathway (formerly North West Headache Management Guideline for Adults)

Version 1.0

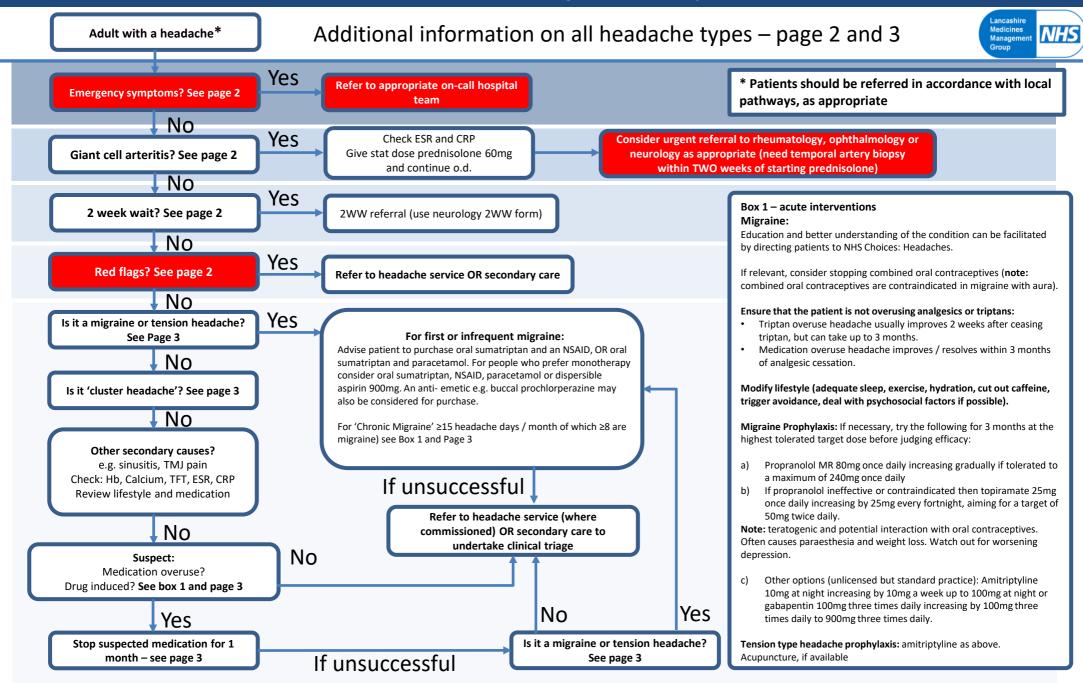

VERSION CONTROL		
Version	Date	Amendments made
Version 1.0		Reformatted version 8 of the North West Headache Management Guideline for Adults to match other LMMG guidelines. Amended clinical content in line with NHSE OTC guidance.

Adult Headache Management Pathway

Adult Headache Management Pathway – additional information

Emergency symptoms or signs

Thunderclap onset

Accelerated or Malignant hypertension

Acute onset with papilloedema

Acute onset with focal neurological signs

Head trauma with raised ICP headache

Photophobia + nuchal rigidity + fever +/- rash

Reduced consciousness

Acute red eye ?acute angle closure glaucoma

New onset headache in:

3rd trimester pregnancy or early postpartum Significant head injury – especially elderly patients with alcohol dependency or patients on anti-coagulants

Red flags

Headache rapidly increasing in severity and frequency despite appropriate treatment

Undifferentiated headache (not migraine or tension headache) of recent origin and present for > 8 weeks

Recurrent headaches triggered by exertion

New onset headache in : > 50 years old (consider giant cell arteritis); immunosuppressed or HIV

Giant Cell Arteritis

Incidence 2/10,000 per year

Consider with presentations of new headache in people > 50 years old

ESR can be normal in 10% - check CRP as well

Symptoms may include: jaw or tongue claudication, visual disturbance, temporal artery: prominent, tender, diminished pulse; other cranial nerve palsies, limb claudication

Many headaches respond to high dose steroids. **However**, do not use response as the sole diagnostic factor.

Tocilizumab for treating giant cell arteritis NICE TA 518: recommended as an option when used with a tapering course of glucocorticoids (and when used alone after glucocorticoids) in adults, only if:

- 1. they have relapsing or refractory disease
- 2. they have not already had tocilizumab
- 3. tocilizumab is stopped after 1 year of uninterrupted treatment at most and
- 4. the company provides it with the discount agreed in the patient access scheme

Urgent Referral to:

Rheumatology if diagnosis clear Neurology if headache or possibly GCA

Ophthalmology if amaurosis fugax / visual loss / diplopia **NOT** migrainous auras

2 Week Wait - suspected cancer referral

Headache with features of raised intracranial pressure:

Actively wakes a patient from sleep, but not migraine or cluster Precipitated by Valsalva manoeuvres e.g. cough, straining at stool Papilloedema

Other symptoms of raised ICP headache including:

Headache present upon waking and easing once up (analgesic overuse can cause this pattern) and worse when recumbent.

Pulse synchronous tinnitus

Episodes of transient visual loss when changing posture e.g. on standing

Vomiting – significance should be judged in context as nausea and vomiting are features of migraine

Headache with new onset seizures

Headache with persistent new or progressive neurological deficit

Adult Headache Management Pathway – additional information

Migraine

Throbbing pain lasting hours – 3 days
Sensitivity to stimuli: light and sound, sometimes smells
Nausea

Aggravated by physical activity (prefers to lie or sit still)

Aura, if present, that evolves slowly (in contrast to TIA or Stroke) and lasts minutes to hour.

Chronic Migraine (≥15 headache days per month of which ≥8 are migraine)

Combination therapy with an oral triptan and an NSAID, or an oral triptan and paracetamol. For people who prefer to take only one drug, consider monotherapy with an oral triptan, NSAID, aspirin dispersible (900 mg) or paracetamol.

Do **not** offer ergots or opioids for the acute treatment of migraine.

Consider an anti-emetic in addition to other acute treatment for migraine even in the absence of nausea and vomiting

Note: MHRA warnings for metoclopramide and domperidone (neurological and cardiac side effects respectively) – for details see MHRA alerts.

https://www.gov.uk/drug-safety-update/metoclopramide-risk-of-neurological-adverse-effects

 $\underline{https://www.gov.uk/drug-safety-update/domperidone-risks-of-cardiac-side-effects}$

Cluster Headache

More common in men
Severe pain lasting 30-120 minutes
Unilateral, side locked

Agitation, pacing (note: migraine patients prefer to keep still)
Unilateral cranial autonomic features: tearing, red conjunctive, ptosis, miosis
nasal stuffiness

Acute treatments:

Offer oxygen and/or a subcutaneous triptan (nasal triptan can be considered [unlicensed indication]).

When using oxygen for the acute treatment of cluster headache:

use 100% oxygen at a flow rate of at least 12 litres per minute with a non-rebreathing mask and a reservoir bag and arrange provision of home and ambulatory oxygen.

Do <u>not</u> offer paracetamol, NSAIDS, opioids, ergots or oral triptans

Tension Type Headache

Band like ache
Mostly featureless
Can have mild photo OR
phonophobia but NO nausea

Treatment:

Aspirin, paracetamol or an NSAID

Do not offer opioids

Analgesic Overuse Headache

Can be migrainous and / or tension type Analgesic intake ≥15 days per month (opiates ≥ 10 days) for ≥ 3 months

Treatment: Stop analgesic for 3 months

Triptan Overuse Headache

Can be migrainous and / or tension type
Triptan intake ≥ 10days per month for ≥ 3
months

Treatment: Stop triptan for 2-3 months
